Application

- Shut-off valve
- **Fluids**
Water, water steam and other fluids based on material selection
- **Industry**
Power engineering, chemical industry, nuclear power
- **Environments**
Normal, tropical, explosive, seismic

Technical description

- Body is die of free forging
- Yoke cast or welded
- Seats are pressed in the body and seal welded
- Sealing surfaces of the seats and wedge are hard-alloyed (Stellite)
- Spindle packing and sealing ring of the pressure seal bonnet are made of expanded graphite
- For the flanged gate valves, the flanges are welded to the body
- The gate valves design includes sizing of the main components according to the pressure-temperature system
- Gate valves can be operated in position open – close

Accessories

- By-pass
- Gland with permanently pressed spring (Live Loading System)
- Membrane Rupture Insurance Devices
- Another accessories upon request

Testing

- Gate valves shall be tested with water for the strength, impermeability, operational capacity and tightness depending on the operating parameters and material of the body according to EN 12266-1
- Minimum test pressure for the strength test is 1.5 x PN
- Strength welds shall be inspected by radiography

Operation

- Hand wheel (on request with locking device)
- Electric servo motor (also for seismic requirements) - standard connection dimensions according to ISO 5210
- Direct remote control
- Bevel gear

Connection

- Welding and flange according to CSN, EN, ANSI, GOST, DIN or according to customer requirements

Installation

- Gate valves can be mounted in any position regardless the direction of the working fluid flow
- Gate valves with electric actuator with oil filling - see installation instructions from the manufacturer
- It is recommended to install the gate valves of larger diameters in the horizontal piping with vertical spindle and control at the top

By-pass

- Gate valves are standardly equipped with the protection of the inner part by the valve K89
- Gate valves up to DN 250 are designed for full pressure drop and bypass is not needed
- AT the customer's request, bypass with one to three valves can be supplied

By-pass

Note: *) upon request

Central cavity equalization against overpressure

In some pipe systems may occur a situation where after the shutdown of the system and after subsequent cooling, a certain amount of water remains in the central part of the closed gate valve, ie in the space above the wedge. If after some time the gate valve closed that way again begins to heat (eg using by-pass), due to the temperature increase the pressure of the fluid between the plates of the wedge and above the wedge will increase. In order not to damage the valve by the pressure increase, the gate valve is fitted with the protection of the inner part by the valve K89. Relief valve is positioned on the pipe led out from the central part just below the pressure seal bonnet. The solution is universal and applicable to all gate valve and operating parameters, does not change bidirectional use of the valve. The safety device is fitted to the condenser loop lead out of the gate valve body outside its thermal insulation. Due to the replacement of the rupture disk during operation, the part of the safety device is the pressure measurement shut-off valve with locking device to prevent unallowed manipulation. By selecting an appropriate condensing loop be used the relief device with horizontal or vertical connection. Detailed description of the relief device is indicated in a separate catalogue sheet "K89 - Membrane rupture insurance device".

Live Loading System

- On request it is possible to supply the packing with permanently pressed spring (so-called Live Loading System)
- This design is used in cases where a special working fluid is used, where the nature of the operation eliminates regular maintenance of the packing or where operating conditions do not permit frequent check of the valves

Dimensions

The table of building dimensions applies only to standard valves with PN 250. For other parameters of the working medium (pressure, temperature), each offer drawing is delivered with specific dimensions according to customer requirements. Upon agreement with the customer, dimensions and standard valves can be adjusted if the strength conditions are maintained.

Notes: „D“ according to CSN, EN, DIN or on demand
 For „d“ larger than 200, control by the hand wheel is not manufactured
 * - control by the hand wheel only to PN 160

Butt-welded type, PN 63 – 250

Flanged type, PN 63 – 250 (PN 400 with electric actuator)

- Flange connection dimensions according to CSN EN 1092-1
- Building length of the flanged valves according to CSN EN 558
- Dimensions according to the drawing are available on request, other flange connection is possible after agreement with the manufacturer

Advantages of construction

A	Protection of the inner part against overpressure: The inner part of the valve is protected against overpressure by the membrane rupture insurance device
B	Bypass: Allows to heat the valve and reduce the pressure drop (available on request)
C	Live Loading System: The stem packing is permanently pressed by a set of disk springs (supplied on request)
D	The wedge design: Reliable fitting and sealing. Allows easy removal of the plates at the customer
E	Sealing surfaces: The sealing surfaces of the wedge and seats are equipped with a weld of hard weld alloy
F	Yoke: Yoke is provided with a bronze spindle nut with needle and ball bearing with the pressure lubrication for the easy control of the valve
G	Actuator connection: Possibility to connect all drives conforming to ISO 5210
H	Dust rings: Dust rings protect the bearings from dirt
I	Spindle: The spindle is non-rotating, rising, allowing better sealing in the packing
J	Pressure seal bonnet: Pressure seal bonnet without a central nut simplifies and accelerates its removal, easier and quicker disassembly by meand of the closing plate.
K	Openings in place of the split ring: Simplify the removal of the split ring
L	Sealing: Pressure seal ring and the sealing rings are made of the expanded graphite. Guarantee reliability
M	Non-rising hand wheel with sticking point: Advantage in case of lack of space and for achieve of required operating effect
