

Disc Bottom Outlet Valves

KEGELBODENVENTILE

SchuF  **FETTEROLF**

Disc Bottom Outlet Valve – General Overview

Development of Bottom Outlet Valves

Bottom Outlet or Drain Valves have been extensively used in the chemical and related industries for almost 100 years. Invented by SchuF in 1923, their initial application was to replace the very simple wooden plug used to close or drain tanks, vessels or pipelines. Their introduction made it possible to drain vessels containing dangerous substances, and handle media under high pressure or temperature safely. The other key benefit for early users of Bottom Outlet Valves was the ability to ensure dead space free draining of vessels or reactors.

Industry Application

Today, Bottom Outlet Valves (BOV) have found applications beyond the chemical and petrochemical industry. They are suitable for pharmaceutical and biotech applications where cross contamination must be avoided. They have also found a place in abrasive slurry and high temperature environments such as in the coal liquefaction and alumina industries.

Model 25BH disc rising valve with metal bellows

Bottom Outlet Valve Types

SchuF has developed a diverse range of Bottom Outlet Valves which include both Disc and Piston (or Ram) categories. The fundamental difference between the two are:

- Disc valves have a shorter length and are therefore ideal where space is limited or weight is a concern. The shorter stroke means that smaller, lighter and faster actuators can be used, saving cost and weight.
- Ram Piston valves have full bore unimpeded flow and are more suitable for vessels that need to be drained or flushed quickly, for highly viscous media or where large samples need to be taken.

Model 25BF disc rising valve with bellows and temperature sensor

Disc Bottom Outlet Valve Models

Disc Bottom Outlet Valves can be supplied as a disc rising or disc lowering model.

The **disc rising** valve models 19 (same size inlet/outlet) and 25 (bigger size inlet than outlet) are most suitable for media where solid materials or crystals can form at the exit point of the vessel. As the disc opens into the vessel automatic crust breaking takes place.

The disc rising valve is also normally a flow to close design, which aids sealing performance.

Disc Bottom Outlet Valve – General Overview

The **disc lowering** valve models 18 (different size inlet/outlet) and 24 (bigger size inlet than outlet) can be used on vessels with low mounted agitators, as it is non intrusive. Disc lowering valves can also be combined with sampling valves.

Valve Bodies

The valve bodies for all models would usually be in various stainless steel grades, but can also be provided in any available castable or weldable material.

Disc Bottom Outlet Valve – Sealing Arrangements

Disc valves are available with a number of different sealing options:

- Model 25BS is typically a Hastelloy or stainless steel valve with a stuffing box seal to the outside.
- Model 25BH is usually a metal or stainless steel valve with a Hastelloy or metal bellows and a back up stuffing box seal.
- Model 25BF is a Teflon or glass lined valve with bellows and back up stuffing box seal.
- Model 25BM features a Teflon or rubber diaphragm seal.

All disc valves can be provided with a “TA Luft” (exacting German environmental emissions standard) compatible stuffing box seal.

Sealing to process options include metal to metal, hard faced material options and PTFE sealing ring.

For the pharmaceutical industry for example, stainless steel grades such as 1.4435 (BN2) and easily polished 316L, 1.4439 or 1.4539 are used. For higher corrosion resistance we can provide Duplex, Alloy 59, Hastelloy C22, C276, B2, B3, Titanium, Zirconium and many others.

Alternatively, cast steel or stainless steel valves can be delivered with isostatically sintered PTFE or glass lined bodies.

Features of Disc Bottom Outlet Valves

Core features of Disc Bottom Outlet Valves include a robust design and construction, high adaptability, and no dead space.

Each SchuF Bottom Outlet Valve is adapted to fit the requirements of the proposed application, whether it be a non standard size connection, highly abrasive material, or low contamination requirements.

Feature Overview

■ Crust Breaking

Disc rising valves (Models 19 or 25) automatically break any crust that may have formed at the bottom of the reactor as they open. They are therefore suited to media containing solids or crystals.

■ Dead Space Free

All valves are fitted exactly to the reactor nozzle to ensure that there is no dead space at the bottom of the reactor. The valves are designed to allow the vessel and themselves to drain completely.

■ Sealing to Atmosphere

To eliminate leakage to the outside, all disc valves can be fitted with a PTFE extruded bellows (Type 25BF), a metal bellows (Type 25BH), or a PTFE diaphragm (25BM). A "TA Luft" compatible stuffing box is also available.

■ Clean-in-place (CIP)

All valves can be fitted with flushing ports (standard with lined valves Type 25BF) allowing cleaning of the valve while a reaction is taking place in the vessel.

■ Temperature Sensing

Placing a temperature sensor in the valve disc ensures that the reactor's contents can be measured even when the batches are very small. The sensor can be removed for calibration whilst the valve is still in service.

■ Multi Purpose

Stainless steel valves are usually sufficient for the food and biochemical industry. For multi-purpose batch plants, producing a variety of chemicals and active ingredients including acids and bases, valves with a higher chemical resistance may be required. SchuF can supply valves in Hastelloy, Titanium and Zirconium or with linings in glass-, rubber- PTFE- and Tantalum.

■ Contamination Free

To avoid the possibility of cross contamination and remnants in gaps, stationary FDA approved solutions such as an o-ring seal, lip seal or expandable seat can be provided. Model 24AV "Sterile Valve" has a single part seat body and disc spindle construction, which ensures that all parts of the valve's interior can be cleaned and sterilised.

■ Fire-safety

To limit the damage a fire may cause it is vital that reactors, storage vessels and their outlet valves remain intact to prevent feeding the fire or polluting the extinguishing agents. All our valves can be offered in a fire-safe version.

Model 24BC disc lowering valve

We are the only manufacturer to be able to do so even for PTFE and glass-lined valves.

■ Integrated Sampling and Flushing

Often space and process consideration prohibit the use of an extra sampling system, especially when there is the danger that the submerged sampling pipe can become blocked, or if there are pollution or cost reasons, not to discard the whole sample.

If space is at a premium, it is possible to combine a wafer type sampling valve with a disc valve in a SchuF patented combination.

Pharmaceutical and Fine Chemical Industry

SchuF disc valves have seen extensive service in the bulk pharmaceutical and fine chemical industries. They are often used in the production of core active ingredient acids and vitamins.

Over the past 15 years the dual pressure of rationalisation and safety & environment regulation have led to many valve developments. SchuF is at the forefront of these developments with a number of innovations:

- Expandable blow up seat (to fill potential dead spaces)
- GMP compliant disc valves
- Fully cleanable and flushable in place features
- Seat-less disc valves

Sterile Valve (Model 24AV)

Sterile valves are widely used in the Pharmaceutical industry and can be supplied to 4 inches as standard or larger sizes as required. The SchuF 24AV sterile valve is a highly versatile valve that can be used as a drain, angle or sampling valve. They are fitted at the bottom of stainless steel, Hastelloy, or glass lined fermentors and reactors. The disc opens into the valve and can seal directly against the reactor flange, thereby eliminating the possibility of a gap between the seat and reactor. Additionally the disc can be contoured to suit the medium drainage properties.

Model 24AV Sterile Valve

Good Manufacturing Practice (GMP) Valves

SchuF offers a complete range of valves which conform to GMP standards. The valves open into the vessel or valve, with a stuffing box seal, bellows seal or a diaphragm seal.

The valves have the following characteristics:

- Completely dead space free
- Easily flushable
- Surfaces can be polished to $Ra < 0.2 \mu$
- Crevice free

These valves are ideal for batch processes, where even the smallest contamination from the previous batch could be fatal. There are a variety of sealing options for GMP compliance as listed below.

1 Large gap for CIP

2 GMP O-ring seal

3 GMP Lip seal

4 Expandable seat

The gap between seat and vessel can be designed CIP conform to be flushed out between different batches (1), or else can be closed off from the process in the vessel using either an O-ring (2), a lip seal (3) or an expandable seat (4).

Dimensions Example for GMP Compliant 25BF

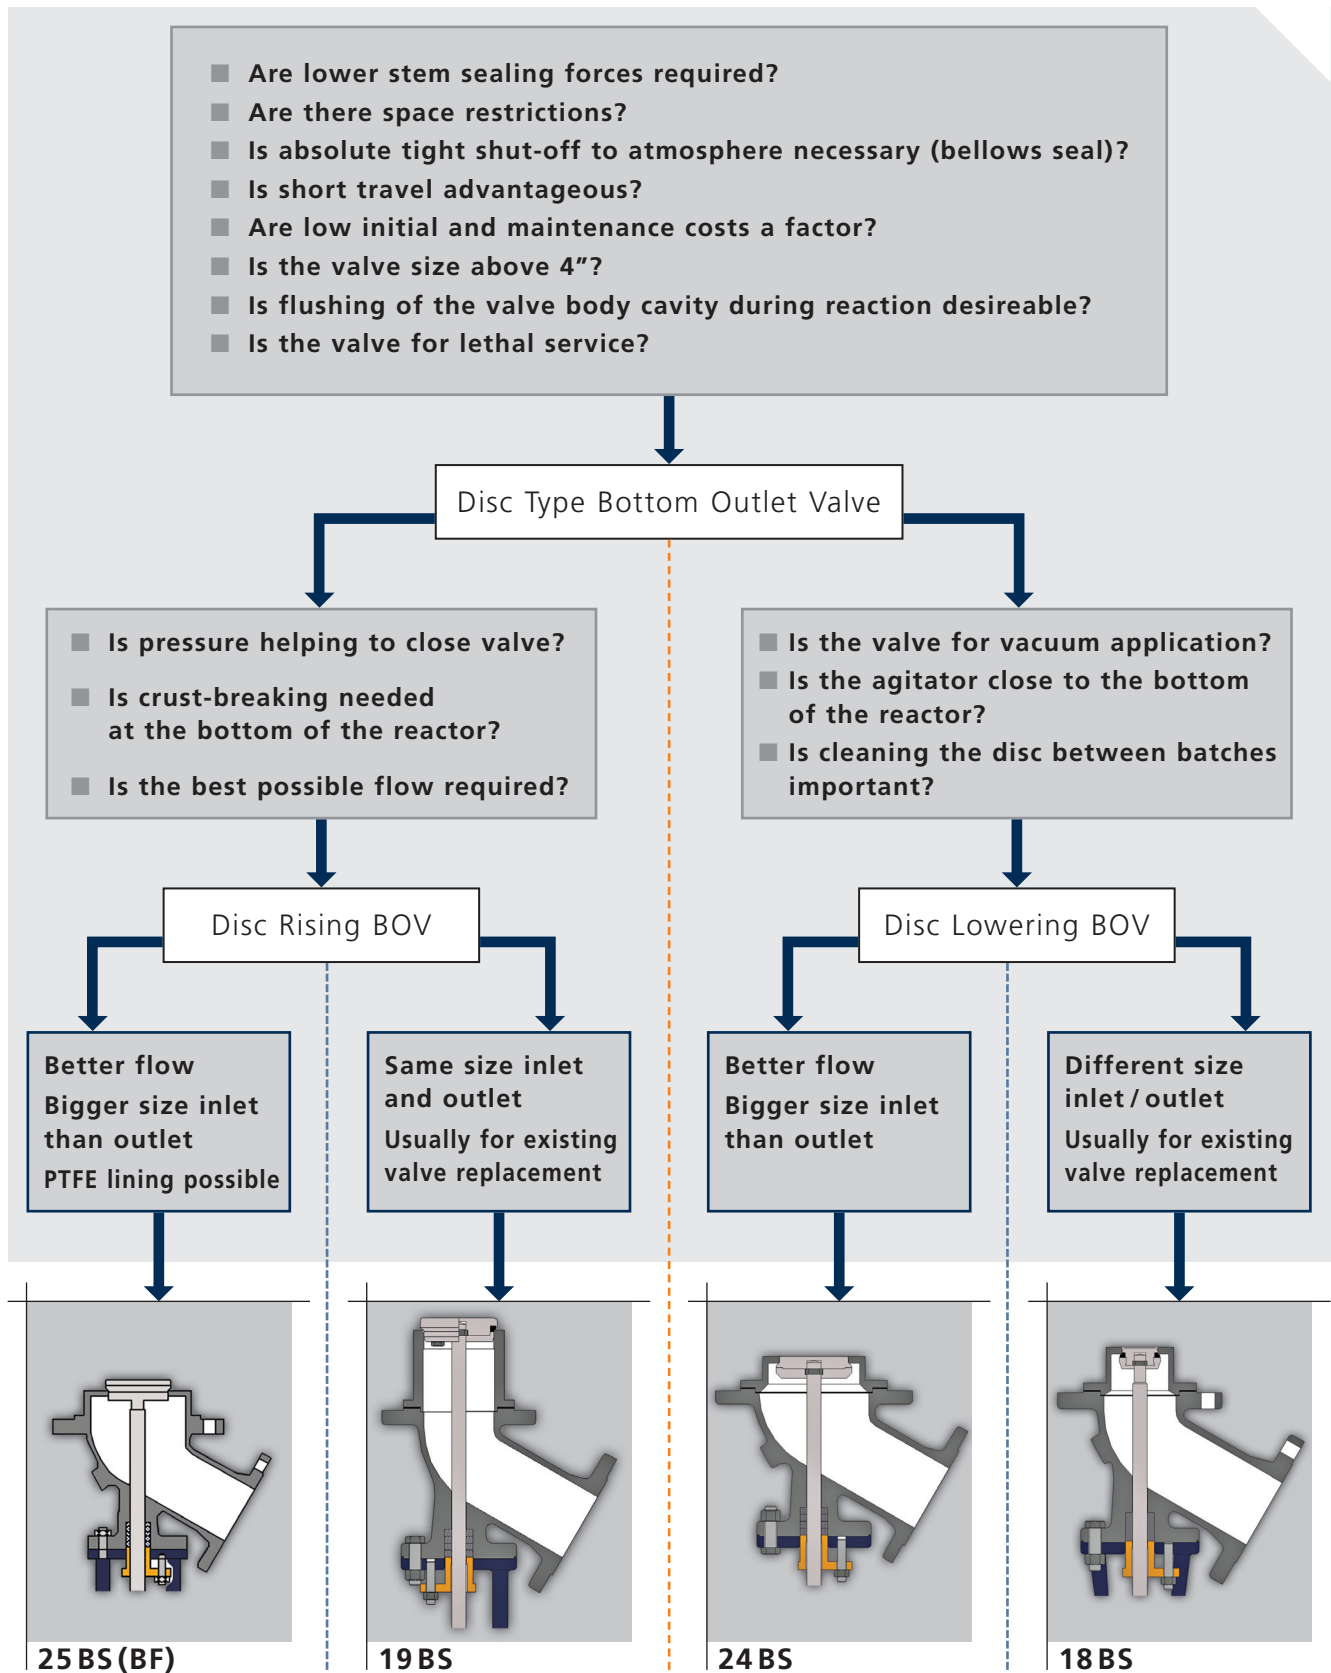

Valve dimension table for Disc BOV model 25BF (PTFE / glass lined)

All dimensions are in mm unless otherwise stated. Dimensions for other BOV models are available on request.

Choosing the appropriate Disc Bottom Outlet Valve

Disc Bottom Outlet Valve Specifications

	Standard	Optional
Size	1" to 18" as standard	Larger on request
Body	Stainless steel 1.4408 (CF-8M)	304, 316L, Duplex, Hastelloy, Monel, Titanium, Nickel, Inconel, Incoloy, etc.
Valve lining	n/a	PTFE, glass, ceramic or rubber
Outlet	45° or 60°	90°
Disc	Stainless steel 1.4571 (316 Ti)	Glass lined, hard faced, tantalum clad, PTFE and all materials under "Body-Optional"
Spindle	Stainless steel 1.4571 (316 Ti)	Hast C276 and all materials under "Body-Optional"
Seat	Stainless steel, replaceable	PTFE lined and all materials under "Body-Optional"
Temperature	minus 10° to 230° C	Higher or lower on request
Pressure	ASME 150, PN16 & PN40	Up to ASME 2500, PN320 or higher on request
Temperature Sensors	n/a	2 x PT 100 sensors with tantalum cap on disc, or stainless steel rod in disc
Actuators	Manual, pneumatic, hydraulic or electric	Side mounting is available Actuation speed down to 0,1 sec.
Fire safe	n/a	Fire safe to BS 6755 Pt. 2 *
Heating Jacket	n/a	On request
Surface coating	n/a	Anodising, Canadising, Titanium Nitriding, Ceramic and Tungsten

* European safety standard similar to API 607.

Atmospheric Sealing Options:

Type BS	stuffing box with packing rings for all models
Type BH	metal bellows, zero emissions to atmosphere, and emergency stuffing box
Type BF	PTFE bellows, zero emissions to atmosphere, and emergency stuffing box
Type BM	diaphragm sealed, zero emissions to atmosphere, and emergency stuffing box

Process and Seat Sealing Options:

Process: PTFE sealing ring, metal to metal and hard faced material options
Seat: O-ring, lip seal and expandable seat

Additional Options:

■ Flushing/Purging connections	■ CIP / GMP	■ Jacking bolts
■ FDA compliant materials	■ Manual over-ride	■ Disc contouring
■ Internal/External polishing	■ T or spool piece	■ Tapered seats
■ Limit switches	■ Leak detection	■ Live loaded packing
	■ Disc grinding	■ Wipers
	■ Solenoid valves	■ Positioners

Model 24BC

Industry Application Case Studies for Disc Valves

PTA Application Case Study

A major North American producer of PTA faced a problem, which had caused a critical PTA process line to run inefficiently. The customer had installed ball valves at the entrance to transfer lines between crystallisers which regularly got stuck due to build up of slurry around and in the ball itself. SchuF resolved the problem by providing a self draining Disc BOV with integrated flushing and no dead space. The combination of a dead space free connection and flushing eliminated the build up of the slurry. Plant efficiency increased significantly thereafter.

Mining Application Case Study

A European Tungsten Carbide mining company faced the problem that an on-off valve installed after a depressurization vessel leaked, and had to be maintained weekly. In this secondary process, tungsten is mixed with caustic soda at high pressure and a highly abrasive slurry results. By replacing the on-off valve with a SchuF Disc BOV the company was able to reduce maintenance to annual checks. According to the plant manager "The valve has worked so well, that I can't even remember when we last had to do any maintenance"

Alumina Service Case Study

The production of alumina requires valves that can withstand significant abrasion and scaling. One important producer of Alumina in Brazil was faced with the problem that their existing feed valve seats would regularly get stuck and consequently not close. This led to equipment damage and production down time. SchuF resolved the problem by designing a special disk grinding mechanism specifically suited to Alumina slurry. With the new design SchuF Disc BOV the alumina producer now has no issues with valve closure.

Polymer Service Case Study

SchuF disc valves are used extensively in the Polymer industry as they are ideal for injecting low viscosity feedstocks. For one particular Asian customer where Vinyl Chloride is used as a feedstock, the disc and seat were contoured to exactly match the vessel wall and a special bellow seal was supplied. This ensured that no atmospheric pollution would take place. The customer reported excellent valve sealing performance.

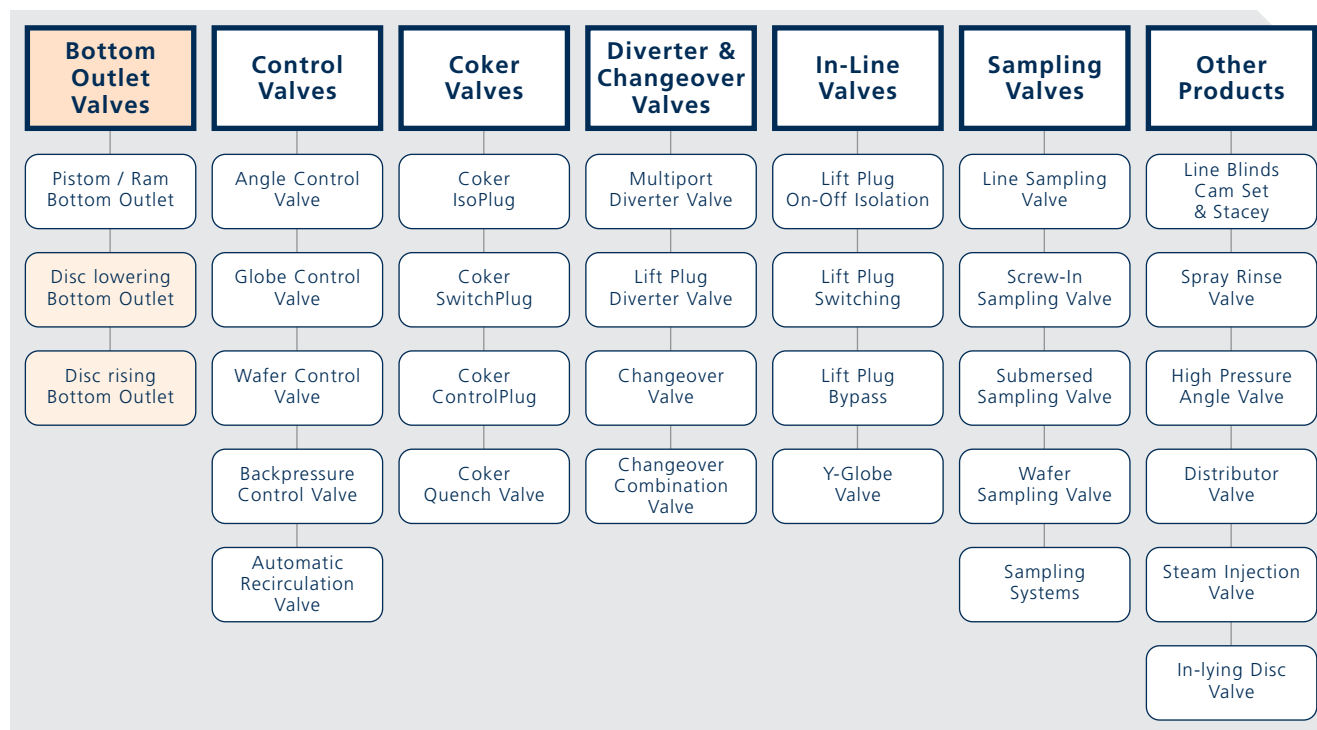

SchuF Valve Portfolio

SchuF has delivered over one million valves during its almost 100 year history to a wide variety of industries in over 50 countries worldwide.

Headquartered near Frankfurt in Germany, the company has additional design and manufacturing centres in Brazil, India, Ireland and the United States.

The SchuF group has sales and agent offices covering almost every country in the world.

We manufacture valve products that control, isolate, divert, and sample liquids, gases, powders, and slurries. Our product range of engineered, customised valves includes:

Sample Bottom Outlet Valve Client List:

- Aker Kvaerner
- Astra Zeneca
- BASF
- BAYER
- Boehringer Ingelheim
- Novartis
- Degussa
- Du Pont
- Formosa Plastics
- GE
- GlaxoSmithKline
- Honeywell
- Indorama
- Ineos
- Lurgi
- Merck
- Mitsui
- Petrobras
- Pfizer
- Reliance
- Roche
- Samsung
- Sandoz
- Sanofi Aventis
- Schering
- Shell
- Shenhua
- Sinopec
- Solvay
- Yisheng
- Uhde Inventa Fischer
